

Do you know about fractions like 0.5 as a fraction?

Posted by Beyond news - 23 Sep 2022 07:23

Fractions are referred to as the components of a whole in mathematics. A single object or a collection of objects might be entire. When we cut a piece of cake in real life from the entire cake, the part represents the percent of the cake. The word "fraction" is derived from Latin. "Fractus" means "broken" in Latin. The fraction was expressed verbally in earlier times. It was afterwards presented in numerical form.

Therefore, the fractional value of [0.5 as a fraction](#) is $1/2$.
